NL Generation
Natural Language Generation

What is NLG useful for?

- Verbalising, Summarising, Querying Knowledge-Bases
- Summarising, Simplifying, Paraphrases one or more Text(s)
- Converting Graphs into Text
Facebook claims its new chatbot beats Google's as the best in the world

It has also open-sourced the AI system to spur further research.

By Karen Hao

April 29, 2020

Opinion
Artificial intelligence (AI)

AI can write just like me. Brace for the robot apocalypse
Hannah Jane Parkinson

This article is more than 3 years old
Sacoolas, who has immunity as a diplomat’s wife, was involved in a traffic collision ... **Prime Minister Johnson** was questioned about the case while speaking to the press at a hospital in Watford. **He said**, “I hope that Anne Sacoolas will come back ... if we can’t resolve it then of course **I will be raising** it myself personally with the White House.

**Generated summary**

Boris Johnson has said **he will raise** the issue of US diplomat Anne Sacoolas’ diplomatic immunity with the White House.
Sacoolas, who has immunity as a diplomat’s wife, was involved in a traffic collision ... Prime Minister Johnson was questioned about the case while speaking to the press at a hospital in Watford. He said, “I hope that Anne Sacoolas will come back ... if we can’t resolve it then of course I will be raising it myself personally with the White House.”

Cisco, Inc. is an American multinational technology conglomerate headquartered in Santa Clara, California. It develops, manufactures and sells networking and telecommunication services and products for consumers, small and medium-sized businesses and service providers. The company is a market leader in several technology and manufacturing sectors, including computer networking, Internet of Things (IoT), unified communications and service provider networking. Cisco was founded in 1984. It is the third-largest public networking company (with an approximate $114 billion market capitalization), and the second-largest U.S. electronics company.
Sacoolas, who has immunity as a diplomat’s wife, was involved in a traffic collision ... **Prime Minister Johnson** was questioned about the case while speaking to the press at a hospital in Watford. He said, “I hope that Anne Sacoolas will come back ... if we can’t resolve it then of course I will be raising it myself personally with the White House.

**Generated summary**

**Boris Johnson** has said he will raise the issue of US diplomat Anne Sacoolas’ diplomatic immunity with the White House.
The NLG Hype

Errors in automatically summarised text

**Title:** Almond-raspberry thumbprint cookies

**Ingredients:** 1 cup butter or margarine softened, 1 cup sugar, 1 can solo almond filling, 2 egg yolks, 1 tsp almond extract, 2 1/2 cups all-purpose flour, 1/2 tsp baking powder, 1/2 tsp salt, 1 can solo raspberry filling

In a large bowl, beat butter and sugar until light and fluffy. Add eggs, one at a time, beating well after each addition. Blend in flour, baking powder, baking soda, salt and baking soda. Add to creamed mixture and mix well. Stir in nuts and vanilla. Drop dough by rounded table spoonfuls 2” apart onto ungreased cookie sheets. Bake 8 to 10 minutes or until edges are lightly browned. Cool on wire racks.
The NLG Hype

The factuality and faithfulness issue

A key issue in Neural NLG is correctness. The generated text may

- Contain factually incorrect data
- Include contradictions and repetitions / redundancies
- Omit information present in the input
- Hallucinate information not present in the input
LaMDA and the Sentient AI Trap

Arguments over whether Google’s large language model has a soul distract from the real-world problems that plague artificial intelligence.

OpenAI’s new language generator GPT-3 is shockingly good—and completely mindless

The AI is the largest language model ever created and can generate amazing human-like text on demand but won’t bring us closer to true intelligence.

By Will Douglas Heaven

July 20, 2020
• A short introduction to Neural Generation

• Four Challenges for Neural NLG
  • Long Input
  • Integrating Knowledge
  • Generating into multiple languages
  • Generating long form text
Neural Generation
Neural Generation

- Represents *(sub)words* as vectors of real numbers called *embeddings*

- Generates text by *predicting the next most probable word* using either a Language Model (decoder) or an Encoder-Decoder

- Increasingly uses *pretrained models*
  - Pretrained word embeddings (Word2Vec, BERT, XLNet, …)
  - Pretrained decoder (GPT2, LAMDA, …)
  - Pretrained encoder-decoder (T5, BART, …)
Neural Word Representations
**Embeddings**

Neural Word Representations

- Words with similar contexts have similar meanings
- Words are represented by vectors of real numbers called *embeddings*

John eats an apple.

Peter eats a pear.

The apple is ripe.

The pear is ripe.

<table>
<thead>
<tr>
<th></th>
<th>JOHN</th>
<th>PETER</th>
<th>EAT</th>
<th>APPLE</th>
<th>PEAR</th>
<th>RIPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOHN</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>PETER</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>EAT</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>APPLE</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>PEAR</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>

<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

APPLE = <1,0,1,0,0,1>

PEAR = <0,1,1,0,0,1>
Embeddings

Neural Word Representations

- Word embeddings are vectors
- The embedding of words with similar meaning are close in the vector space
Word embeddings

Can be

• Learned during training

• Pretrained (Word2Vec, Glove, BERT, …)
Neural Language Models
Language Model

How probable is a sequence of words?

Determines the probability of a sequence of words

\[ P(W) = P(w_1, w_2, w_3 \ldots w_n) \]

Ex (in English)

\begin{align*}
P_1 &= P("a quick brown dog") \\
P_2 &= P("dog quick a brown") \\
P_3 &= P("un chien quick brown") \\
P_4 &= P("un chien brun rapide")
\end{align*}

\[ P_1 > P_2 > P_3 > P_4 \]
Language Models can be used to generate a sentence by auto-regressively predicting the next word given a previous context.

France is where I grew up and where I now work. I speak fluent French.

\[
p(\text{French} \mid \text{France is where I grew up and where I now work. I speak fluent}) >
\]
\[
p(\text{English} \mid \text{France } \ldots \text{ fluent}) >
\]
\[
p(\text{Pizza} \mid \text{France } \ldots \text{ fluent}) >
\]
\[
p(\text{the} \mid \text{France } \ldots \text{ fluent})
\]
Pre-Neural LM

The probability of a sequence of words is computed using the chain Rule of Probability and Markov assumption

$$P(w_1, \ldots, w_n) = \prod_i P(w_i | w_{i-k}, \ldots, w_{i-1})$$

In Pre-neural model, probabilities are estimated on large corpora

$$P(w_n | w_1, \ldots, w_{n-1}) = \frac{\text{count}(w_1, w_2, w_3 \ldots w_n)}{\text{count}(w_1, w_2, w_3 \ldots w_{n-1})}$$

Example

$$P(\text{its water is so transparent}) = P(\text{its}) \times P(\text{ water | its}) \times P(\text{ is | its water }) \times P(\text{so | its water is }) \times P(\text{ transparent | its water is so})$$
Neural LMs

Using an RNN

- At each step, RNNs output a probability distribution over the vocabulary.

- The next word is predicted using sampling (or beam search, top-k sampling, nucleus sampling, ranking).

\[
\hat{y}^{(t)} = \text{softmax} \left( U h^{(t)} + b \right) 
\]
The Encoder-Decoder Model

**INPUT** → **ENCODER** Neural Network → **Continuous Representation** → **DECODER** Neural Network → **Text**

Auto-regressive Generation

**INPUT**:
- Text
- KB
- Graph
- Image
Encoders

- Recurrent Neural Network (sequences)
- Convolutional Neural Network (Images and Text)
- Graph Encoder (Knowledge Bases, Tabular Data, RDF store)
- Transformer (sequences)
Decoders

- Recurrent Neural Network
- Transformer
Encoding and Decoding with a Recurrent Neural Network (RNN)
**Encoding the Input with a Recurrent Neural Network**

- Processes sequences from left-to-right
- Recurs over the input
- Outputs a new hidden state at each step

\[ h_t = \tanh(W_1 h_{t-1} + W_2 x_t) \]

*The last hidden state is the input representation*
Decoding with a Recurrent NN

*Outputs a word at each step*

- Use a softmax layer to compute a *probability distribution over the output vocabulary*
- Sample a word from this distribution
- The predicted word is the input to the next decoding step

\[ P_t = \text{softmax}(W_t h_t) \]
Generating with a Recurrent NN

$p(\text{Fine}|<s>, \text{How are you doing?})$

Conditional Generation
Generating with a Recurrent NN

\[ p(,|<s>\text{ Fine, How are you doing?}) \]
Generating with a Recurrent NN

\[ p(\text{and}|<s> \text{ Fine,; How are you doing?}) \]

Shortcomings and Solutions

• In practice, RNNs cannot handle long context
Exploding and Vanishing Gradients
  >> GRU, LSTM

• RNNs only know about the left context
  >> Bi-directional RNN
**Shortcomings and Solutions**

- The input to decoding is a fixed size vector
  
  > Attention

  _permits focusing on the relevant part of the input_

- Because they process a sequence one word at a time, RNNs are slow to train

  > Convolutional Neural Network, Transformer

  _Process each input item in parallel_
Shortcomings and Solutions

• Word unseen at training time represented as UNK at test time
  >> BPE (Byte Pair Encoding), WordPieces
  *Uses subwords rather than words*
Words and Subwords

- Neural Language Models assume a finite vocabulary
- All words unseen at training time are mapped to UNK
- For language with a rich morphology (Georgian, Swahili etc.), this is even more problematic
**Words and Subwords**

- Instead of handling words, subword models learn a vocabulary of subwords.
- At training and test time, each word is split into a sequence of subwords.
- **Byte-Pair encoding (BPE)** is one way to define a subword vocabulary.
  - Start with characters.
  - Add most frequent n-grams as subword.
  - Iterate until desired vocabulary size is reached.
BPE Example

Dictionary

<table>
<thead>
<tr>
<th>5</th>
<th>low</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>lower</td>
</tr>
<tr>
<td>6</td>
<td>newest</td>
</tr>
<tr>
<td>3</td>
<td>widest</td>
</tr>
</tbody>
</table>

Vocabulary

| l, o, w, e, r, n, w, s, t, i, d |

Start with all characters in vocab

Dictionary

<table>
<thead>
<tr>
<th>5</th>
<th>low</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>lower</td>
</tr>
<tr>
<td>6</td>
<td>newest</td>
</tr>
<tr>
<td>3</td>
<td>widest</td>
</tr>
</tbody>
</table>

Vocabulary

| l, o, w, e, r, n, w, s, t, i, d, es |

Add a pair (e, s) with freq 9
**BPE Example**

**Dictionary**

5. low  
2. lower  
6. new est  
3. widest

**Vocabulary**

l, o, w, e, r, n, w, s, t, i, d, es, est

Add a pair (es, t) with freq 9
Attention

- The input is compressed into a fixed-length vector
- Performance decreases with the length of the input
Attention

- Computes a score between each input token encoder state and the current state
  \[ a_{t,j} = \text{score}(s_t, h_j) \]
  \[ \alpha_t = \text{softmax}(a_t) \]
- The context vector is the weighted sum of the encoder states.
  \[ c_t = \text{softmax}(\sum_j \alpha_{t,j} \cdot h_j) \]
- The new state is computed taking into account this context vector.
  \[ s_t = f(s_{t-1}, y_{t-1}, c_t) \]
Attention

Attention is a way to obtain a fixed-size representation of an arbitrary set of representations (the values) dependent on some other representation (the query)

**Encoder-Decoder Cross-Attention**
- Query = decoder state
- Values = encoder hidden states

**Transformer Self-Attention**
- Query = token embedding
- Values = surrounding tokens embeddings
Pretraining (Self-Supervised Learning)

Word Embedding, Encoder
• Word2Vec, Glove, BERT …

Language Models
• GPT2, DialoGPT, LAMDA …

Encoder-Decoder
• T5, BART ….
**BERT**

Transformer encoder pretrained on BooksCorpus (800M words) and English Wikipedia (2,500M words)

Two loss functions

- Predict masked tokens (Masked Language Modelling)
- Next sentence prediction classification (true if next sentence is the correct continuation)

The training loss is the sum of the mean masked LM likelihood and mean next sentence prediction likelihood
BERT Masked Language Modeling

Mask 1 word in 7
- Too little masking: too expensive to train
- Too much masking: not enough context

Input = [CLS] the man went to [MASK] store [SEP] he bought a gallon [MASK] milk [SEP]

the

of
**BERT Fine Tuning**

- Sentence representation = final hidden state output by the Transformer (= [CLS] word embedding)
- Add a classification layer
- Fine tune all BERT parameters and the classification layer jointly to maximize the log-probability of the correct label
GPT2

• **Unsupervised Pre-training**
  Train a LM on a large corpus of text (BookCorpus 7K books)

• **Supervised Fine-tuning**
  • Input passed through pre-trained LM
  • Feed final LM activation to added linear + softmax output layers to predict output
  • Task-aware input transformations

• Significantly improves upon the SOTA in 9 out of 12 NLU tasks
BART

- Transformer Encoder-Decoder
- Denoising Auto-Encoder
  - Corrupt text with a noising function
  - Model learns to reconstruct original text
- Experiment with different noising functions
BART

Achieves new state-of-the-art results on a number of text generation tasks

Text infilling (reconstruct spans) demonstrates the most consistently strong performance

Token masking (reconstruct missing tokens) is crucial

Document Rotation and Sentence Shuffling perform poorly in isolation

Puppies are very cute.

Low TF-IDF overlap with query Not added.
Knowledge Graph Construction

Compresses the input by
- Merging redundant information
- Dropping words
- Filtering out irrelevant triples

Reduces redundancy
- Merging nodes, edges and redundant triples

Filters out irrelevant content
- Tf-idf overlap (Question, Triple)
How much does the graph manage to compress the input?

Knowledge Graph Construction drastically reduces the input size.
How much does the graph preserve relevant information?

TF-IDF extraction is missing 38% of the answer tokens
Knowledge Graph Construction contains More Answer

The graph extracted for 850 tokens is missing 35% of the answer tokens
**Knowledge Graph Construction contains More Answer**

The graph for the full Input is missing only 8.7% of the answer tokens.

Question: Why is touching microfiber towels such an uncomfortable feeling?

True Answer: Do you mean the kind of cloths used to clean glasses and lenses? I’ve never noticed any uncomfortable feeling myself, but I do find touching certain cleaning cloths can be quite uncomfortable. There’s a brand called “e - cloth” which market themselves as not needing any cleaning supplies. Basically the threads have tiny little hooks and barbs in them, so dragging them over skin makes you feel like it’s catching against you.

Generation: The microfiber is made up of a bunch of tiny fibers that are attached to them. When you touch them, the fibers that make up the microfiber are attracted to each other. When they touch, they’re attracted to the other end of the fiber, which is what makes them feel uncomfortable.

Fluent answer, factually correct
Some repetition (“attracted to each other”)
Example of Generated Text (ELI5)

**Question:** Why do we have nightmares when stressed out?

**True Answer:** I can tell you that your mind, and in particular your dreams, are subject to the input that it the journey of your life, as you have interpreted it. Yours dreams tend to be your subconscious representing issues you have within, whether it be past or present, with things and people that are sort of “preinterpreted symbology” from your deep and ever power subconsciousness. All your nightmares are just dreams, and your inner mind knows exactly can mess with you the most, and sometimes it brings that to light, it usually being an issue you may be stressed about.

**Generation:** When you’re stressed, your brain releases a hormone called cortisol. This hormone is released by your adrenal glands, and is released when you are stressed. This is why it’s called “fight-or-flight” mode. When your body is stressed, it releases hormones that make you feel more stressed. The reason why you don’t feel stressed is because your brain is trying to get rid of the stress hormone, which causes you to feel stressed, and you’re less likely to get stressed. If you’re really stressed, you’re probably going to be more stressed than if you weren’t stressed.

**Repetitions (“when you are stressed”)**

**Non sense fragments (“The reason ...get stressed”)**
Example of Generated Text (WikiSum)

Title: wylie rogers

True Paragraph: wylie rogers (born march 16, 1985) is an american ice hockey goaltender. he played with the rio grande valley killer bees of the central hockey league. prior to turning professional, rogers attended the university of alaska fairbanks where he played four seasons of ncaa men’s division i ice hockey with the alaska nanooks men’s ice hockey team. rogers played the 2010-11 season in the netherlands with the heerenveen flyers.

Generation: wylie rogers is an american football coach and former player. he is currently the head football coach at the university of north carolina at chapel hill. rogers played college football at north carolina state university. he was a member of the north carolina tar heels men’s football team that won the ncaa division i football championship in 2012. he also played for the university’s men’s basketball team. after his playing career ended, rogers was hired as the head coach at unc chapel hill in 2013. he led the tar heels to their first ncaa division ii championship in 2015.

Fluent text with nice, elaborate discourse structure
Incorrect facts (Wylie Rogers is an ice hockey player not a football coach. University of Alaska not North Carolina. etc;)

  - Romance: Spanish/Portuguese
  - Germanic: Swedish/Danish
  - Uralic: Finnish/Estonian
  - Slavic: Czech/Slovak
Human Evaluation

• **Semantic Accuracy:**
  Does the hypothesis correctly paraphrase the reference?

• **Morphology:**
  Is the morphology correct? Are agreement constraints e.g., verb/subject, noun/adjective respected?

• **Word Order:**
  Is the word order natural sounding?
Human Evaluation: Semantic Accuracy

![Semantic Accuracy Bars](image-url)
Human Evaluation

The scores are uniformly high across languages for both Morphology and Word Order.

A Multilingual model generalises well across languages.
This point will certainly be the subject of subsequent further debates in the council.

This is a point that will undoubtedly be discussed later in the council.

Je ne suis pas favorable à des exceptions à cette règle.

A mon avis, il n’est pas bon de faire des exceptions à cette règle.
Human evaluation demonstrates multilingual techniques generalize across languages
Human evaluation demonstrates multilingual techniques generalize across languages.

Multilingual benefits from increased training data and performs better than monilingual.
Human evaluation demonstrates multilingual techniques generalize across languages.

Multilingual benefits from increased training data and performs better than monilingual.

Using English-Centric AMR, we can decode into many different target-side languages.

Joan Paton

Joan Burton Paton (1916–April 2000) was an Australian teacher, naturalist, environmentalist and ornithologist. One of the first women to become a member of the exclusive Adelaide Ornithologists Club, of which she was elected President 1991–1993, she also served as president of the South Australian Ornithologists Association (1979–1982). Her father was Professor Sir John Burton Cleland, a notable microbiologist and pathologist who strongly encouraged her early interest in natural history.

Early life and education

Joan Burton Paton was born in Sydney, New South Wales, the daughter of John Burton Cleland (1878–1974) and his wife, Dea Isabel Paton (1880–1955). She had three sisters, Dr Margaret Burton Cleland, Elizabeth Robson Cleland and Barbara Burton Cleland; and a brother, William Paton ‘Biff’ Cleland, who became a surgeon. The father encouraged his children's interest in science. Joan Paton was educated at the University of Adelaide, where she majored in organic chemistry and biochemistry. In 1951 she married Ernest Norman Paton (1922–1985), son of Adolph Ernest Paton and Ida Marie Payton. Their son is Prof David Cleland Paton.

Career

In 1967 Paton became a lecturer on ornithology in South Australia's Workers' Educational Association. Among those she inspired to work in ornithology and environmental conservation was Margaret Cameron, who became the President of the Royal Australasian Ornithologists Union (RAOU). Paton was active in the RAOU, as well as in the South Australian Ornithologists Association (SAOA), of which she was elected Vice-President 1974–1975, and President 1979–1982. She was one of the first women to become a member of the exclusive Adelaide Ornithologists Club, of which she was elected president (1991–1993).

Legacy and honours

- 1990: she was made an Honorary Member of the SAOA.
- 1996: she was made an Honorary Member of the Adelaide Ornithologists Club.

Toplevel

Ashley McKenzie is a Canadian film director, screenwriter, and producer. She is the winner of the Stella Artois Jay Scott Prize for Emerging Talent at the 2016 Toronto International Film Festival. Her first feature film, Werewolf, premiered at the Toronto Film Festival in 2016. She has also directed short films for the National Film Board of Canada and the Canadian Screen Actors Guild. She was born in Montreal, Quebec, Canada, and grew up in Ottawa, Ontario. [1,3,11,13,14]

Personal life

McKenzie was born in London, England. She is the daughter of Alexander McKenzie, who was a member of the British rock band The Beatles. She has a younger sister, Jessica, who is also a singer. She was educated at St Mary’s College, Oxford, where she graduated with a bachelor of arts degree in English literature. She also studied at the University of London. She married fellow X Factor contestant Andrew Davies in September 2006. They have two children, a son and a daughter. [3,4,7,8,10,11]

Career

McKenzie was a contestant on the third series of the X-Factor in 2006. She was eliminated in the first week of the competition. In 2007, McKenzie released her debut single "Don't Pretend You Hadn't, Now..." which peaked at No. 160; 2 on the UK singles chart. She also released a second single, "I'm Not Afraid", in 2008. In 2009, she released her third single, "Don't Pretend You Haven't, Now". In 2010, she was a judge on the X Factor UK. [2]
Conclusion
Open Challenges

- **Factuality, faithfulness to the input**
  (evaluation and implementation)
- Multilingual NLG: generating from and into multiple languages
  Document level Simplification
- Multi-document, multi-format, summarisation
- Domain adaptation, style transfer
Thank you!
