Well Quasi Orders (WQO)

- ▶ Classical defn. for $R : \text{rel}_2 X$ (ie. $X \rightarrow X \rightarrow \text{Prop}$) :
 - ▶ R is a Quasi Order (refl., trans.)
 - ▶ Almost Full (AF): $\forall f : \mathbb{N} \rightarrow X, \exists i < j, R f_i f_j$
 - ▶ any ∞ *sequence* contains a **good pair**
 - ▶ univ. quantified over ∞ *sequences*, as classical wf.

Well Quasi Orders (WQO)

- ▶ Classical defn. for $R : \text{rel}_2 X$ (ie. $X \rightarrow X \rightarrow \text{Prop}$) :
 - ▶ R is a Quasi Order (refl., trans.)
 - ▶ Almost Full (AF): $\forall f : \mathbb{N} \rightarrow X, \exists i < j, R f_i f_j$
 - ▶ any ∞ sequence contains a **good pair**
 - ▶ univ. quantified over ∞ sequences, as classical wf.
- ▶ Important in computer science and mathematics
 - ▶ termination: terminator rule, Karp-Miller
 - ▶ decidability: relevance logic (Kripke)
 - ▶ polynomial ideals and Gröbner basis (Hilbert)
 - ▶ Dickson, Higman, Kruskal, Robertson-Seymour

Well Quasi Orders (WQO)

- ▶ Classical defn. for $R : \text{rel}_2 X$ (ie. $X \rightarrow X \rightarrow \text{Prop}$) :
 - ▶ R is a Quasi Order (refl., trans.)
 - ▶ Almost Full (AF): $\forall f : \mathbb{N} \rightarrow X, \exists i < j, R f_i f_j$
 - ▶ any ∞ *sequence* contains a **good pair**
 - ▶ univ. quantified over ∞ *sequences*, as classical wf.
- ▶ Important in computer science and mathematics
 - ▶ termination: terminator rule, Karp-Miller
 - ▶ decidability: relevance logic (Kripke)
 - ▶ polynomial ideals and Gröbner basis (Hilbert)
 - ▶ Dickson, Higman, Kruskal, Robertson-Seymour
- ▶ This AF notion is *constructively* too weak:
 - ▶ requires added constructively “acceptable” axioms
 - ▶ Count. Ch., bar ind. princ. (Veldman&Bezem 93)
 - ▶ Stumps and Brouwer’s thesis (Veldman 2004)
 - ▶ limited to relations over \mathbb{N}

AF relations in Inductive Type Theory

- ▶ *About Brouwer's Fan Theorem* (Coquand 2003):
 - ▶ intuitive explanation of this constructive weakness
 - ▶ Almost Full: $\boxed{\forall f : \mathbb{N} \rightarrow X}$...
 - ▶ only captures sequences $\mathbb{N} \rightarrow X$ given by **laws**
 - ▶ bar ind. predicates capture arbitrary ∞ sequences

AF relations in Inductive Type Theory

- ▶ *About Brouwer's Fan Theorem* (Coquand 2003):
 - ▶ intuitive explanation of this constructive weakness
 - ▶ Almost Full: $\boxed{\forall f : \mathbb{N} \rightarrow X}$...
 - ▶ only captures sequences $\mathbb{N} \rightarrow X$ given by **laws**
 - ▶ bar ind. predicates capture arbitrary ∞ sequences
- ▶ Stronger (constructive) AF notions:
 - ▶ do not require added axioms
 - ▶ bar ind. predicates (Coquand&Fridlender 93)
 - ▶ ind. well-foundedness (Seisenberger 2003)
 - ▶ only for decidable relations
 - ▶ inductive AF relations (Vytiniostis *et al.* 2012)

Why (quasi) morphisms are important

- ▶ Veldman's proof of Kruskal in Coq (DLW2015)
 - ▶ Major cleanup and refactoring (2022–24)
 - ▶ Morphisms used extensively

Why (quasi) morphisms are important

- ▶ Veldman's proof of Kruskal in Coq (DLW2015)
 - ▶ Major cleanup and refactoring (2022–24)
 - ▶ Morphisms used extensively
- ▶ Surjective relational morphisms
 - ▶ Monotonicity, functional maps have drawbacks
 - ▶ But rel. morph. versatile tool to transfer AF
- ▶ Quasi morphisms
 - ▶ Emerged as an abstraction (was inlined)
 - ▶ Can be understood independently
 - ▶ Factors out FAN and bar inductive predicates

Inductive Almost Full relations

- ▶ Inductive predicate (Vytiniostis *et al.* 2012)
- ▶ For $R : \text{rel}_2 X$, define **af** $R : \text{Prop}$ (or **Type**)

$$\frac{\forall x y, R x y}{\text{af } R} \langle \text{af_full} \rangle \qquad \frac{\forall a, \text{af } R \uparrow a}{\text{af } R} \langle \text{af_lift} \rangle$$

Inductive Almost Full relations

- ▶ Inductive predicate (Vytiniostis *et al.* 2012)
- ▶ For $R : \text{rel}_2 X$, define **af** $R : \text{Prop}$ (or **Type**)

$$\frac{\forall x y, R x y}{\text{af } R} \langle \text{af_full} \rangle \quad \frac{\forall a, \text{af } R \uparrow a}{\text{af } R} \langle \text{af_lift} \rangle$$

- ▶ the *lifted relation*: $(R \uparrow a) x y \doteq R x y \vee R a x$
- ▶ any seq. containing x (R -above a) is $R \uparrow a$ -good

Inductive Almost Full relations

- ▶ Inductive predicate (Vytiniostis *et al.* 2012)
- ▶ For $R : \text{rel}_2 X$, define **af** $R : \text{Prop}$ (or Type)

$$\frac{\forall x y, R x y}{\text{af } R} \langle \text{af_full} \rangle \quad \frac{\forall a, \text{af } R \uparrow a}{\text{af } R} \langle \text{af_lift} \rangle$$

- ▶ the *lifted relation*: $(R \uparrow a) x y \doteq R x y \vee R a x$
- ▶ any seq. containing x (R -above a) is $R \uparrow a$ -good
- ▶ any sequence of liftings ultimately renders R full and

$$\text{af } R \rightarrow \forall f : \mathbb{N} \rightarrow X, \exists_t m \exists i < j < m, R f_i f_j$$

Inductive Almost Full relations

- ▶ Inductive predicate (Vytiniostis *et al.* 2012)
- ▶ For $R : \text{rel}_2 X$, define **af** $R : \text{Prop}$ (or Type)

$$\frac{\forall x y, R x y}{\text{af } R} \langle \text{af_full} \rangle \quad \frac{\forall a, \text{af } R \uparrow a}{\text{af } R} \langle \text{af_lift} \rangle$$

- ▶ the *lifted relation*: $(R \uparrow a) x y \doteq R x y \vee R a x$
- ▶ any seq. containing x (R -above a) is $R \uparrow a$ -good
- ▶ any sequence of liftings ultimately renders R full and

$$\text{af } R \rightarrow \forall f : \mathbb{N} \rightarrow X, \exists_t m \exists i < j < m, R f_i f_j$$

- ▶ Enough for constructive Ramsey (Dickson's lemma):

$$\text{af } R \rightarrow \text{af } T \rightarrow \begin{cases} \text{af } (R \cap T) \\ \text{af } (R \times T) \end{cases}$$

AF transfer: how to prove $\text{af } R \rightarrow \text{af } T$

- ▶ In the artifact of (Vytiniostis *et al.* 2012)
- ▶ $\text{af_mono} : R \subseteq T \rightarrow \text{af } R \rightarrow \text{af } T$
 - ▶ limited: $R, T : \text{rel}_2 X$ have same carrier type

AF transfer: how to prove $\text{af } R \rightarrow \text{af } T$

- ▶ In the artifact of (Vytiniostis *et al.* 2012)
- ▶ $\text{af_mono} : R \subseteq T \rightarrow \text{af } R \rightarrow \text{af } T$
 - ▶ limited: $R, T : \text{rel}_2 X$ have same carrier type
- ▶ $\text{af_comap} : \text{af } R \rightarrow \text{af } (\lambda x_1 x_2, R (f x_1) (f x_2))$
 - ▶ impose a shape $R (f \cdot) (f \cdot)$ on goal

AF transfer: how to prove $\text{af } R \rightarrow \text{af } T$

- ▶ In the artifact of (Vytiniostis *et al.* 2012)
- ▶ $\text{af_mono} : R \subseteq T \rightarrow \text{af } R \rightarrow \text{af } T$
 - ▶ limited: $R, T : \text{rel}_2 X$ have same carrier type
- ▶ $\text{af_comap} : \text{af } R \rightarrow \text{af } (\lambda x_1 x_2, R (f x_1) (f x_2))$
 - ▶ impose a shape $R (f \cdot) (f \cdot)$ on goal
- ▶ Transfers $\text{af } R \rightarrow \text{af } T$ w/o those limitations
- ▶ Using surjective morphisms $f : X \rightarrow Y$
 - ▶ surjective: $\forall y : Y, \exists_t x : X, y = f x$
 - ▶ morphism: $\forall x_1 x_2, R x_1 x_2 \rightarrow T (f x_1) (f x_2)$

AF transfer: how to prove $\text{af } R \rightarrow \text{af } T$

- ▶ In the artifact of (Vytiniostis *et al.* 2012)
- ▶ $\text{af_mono} : R \subseteq T \rightarrow \text{af } R \rightarrow \text{af } T$
 - ▶ limited: $R, T : \text{rel}_2 X$ have same carrier type
- ▶ $\text{af_comap} : \text{af } R \rightarrow \text{af } (\lambda x_1 x_2, R (f x_1) (f x_2))$
 - ▶ impose a shape $R (f \cdot) (f \cdot)$ on goal
- ▶ Transfers $\text{af } R \rightarrow \text{af } T$ w/o those limitations
- ▶ Using surjective morphisms $f : X \rightarrow Y$
 - ▶ surjective: $\forall y : Y, \exists_t x : X, y = f x$
 - ▶ morphism: $\forall x_1 x_2, R x_1 x_2 \rightarrow T (f x_1) (f x_2)$
- ▶ But what about e.g. $\text{af } R \rightarrow \text{af } (R \Downarrow P)$?
 - ▶ surjective on to carrier $\{y \mid P y\}$?
 - ▶ unless assuming P to be Boolean...

Surjective relational morphisms

- ▶ A restricted rel. $R \Downarrow P$ has carrier type $\{x \mid P x\}$
 - ▶ is an important use case
 - ▶ P decidable/Boolean is too strong assumption

Surjective relational morphisms

- ▶ A restricted rel. $R \Downarrow P$ has carrier type $\{x \mid P x\}$
 - ▶ is an important use case
 - ▶ P decidable/Boolean is too strong assumption
- ▶ But the morphism *need not be a function!!*
- ▶ As a **relational map**: $f : X \rightarrow Y \rightarrow \text{Prop}$ with
 - ▶ $\forall y : Y, \exists_t x : X, f x y$
 - ▶ $\forall x_1 x_2 y_1 y_2, f x_1 y_1 \rightarrow f x_2 y_2 \rightarrow R x_1 x_2 \rightarrow T y_1 y_2$
- ▶ We get $\boxed{\text{af } R \rightarrow \text{af } T}$ under surjective morphisms

Surjective relational morphisms

- ▶ A restricted rel. $R \Downarrow P$ has carrier type $\{x \mid P x\}$
 - ▶ is an important use case
 - ▶ P decidable/Boolean is too strong assumption
- ▶ But the morphism *need not be a function!!*
- ▶ As a **relational map**: $f : X \rightarrow Y \rightarrow \text{Prop}$ with
 - ▶ $\forall y : Y, \exists_t x : X, f x y$
 - ▶ $\forall x_1 x_2 y_1 y_2, f x_1 y_1 \rightarrow f x_2 y_2 \rightarrow R x_1 x_2 \rightarrow T y_1 y_2$
- ▶ We get $\text{af } R \rightarrow \text{af } T$ under surjective morphisms
- ▶ Versatile tool, subsumes `af_mono` and `af_comap`
- ▶ Example of direct application:
 - ▶ $\text{af } R \rightarrow \text{af } (R \Downarrow P)$ (partial id. map)
 - ▶ $\text{af } R \uparrow a \leftrightarrow \text{af } R \Downarrow (\neg R a)$ (when $R a$ dec.)

Transfers using Quasi morphisms

- ▶ Inlined in (Fridlender99) and (Veldman04) proofs
 - ▶ a bit specific to this use case
 - ▶ but abstracts away the FAN theorem
- ▶ For transfers: $\boxed{\text{af } R \rightarrow \text{af } T \uparrow y_0}$

Transfers using Quasi morphisms

- ▶ Inlined in (Fridlender99) and (Veldman04) proofs
 - ▶ a bit specific to this use case
 - ▶ but abstracts away the FAN theorem
- ▶ For transfers: $\boxed{\text{af } R \rightarrow \text{af } T \uparrow y_0}$
- ▶ An *evaluation* function $ev : X \rightarrow Y$
 - ▶ $X = \text{analyses}$, $Y = \text{evaluations}$
 - ▶ $E : \text{rel}_1 X$ are *exceptional analyses*
 - ▶ finite inverse image: $\forall y, \text{fin}(ev^{-1} y)$
 - ▶ $\forall x_1 x_2, R x_1 x_2 \rightarrow T (ev x_1) (ev x_2) \vee E x_1$
 - ▶ $\forall y, (ev^{-1} y) \subseteq E \rightarrow T y_0 y$

Transfers using Quasi morphisms

- ▶ Inlined in (Fridlender99) and (Veldman04) proofs
 - ▶ a bit specific to this use case
 - ▶ but abstracts away the FAN theorem
- ▶ For transfers: $\boxed{\text{af } R \rightarrow \text{af } T \uparrow y_0}$
- ▶ An *evaluation* function $ev : X \rightarrow Y$
 - ▶ $X = \text{analyses}$, $Y = \text{evaluations}$
 - ▶ $E : \text{rel}_1 X$ are *exceptional analyses*
 - ▶ finite inverse image: $\forall y, \text{fin}(ev^{-1} y)$
 - ▶ $\forall x_1 x_2, R x_1 x_2 \rightarrow T (ev x_1) (ev x_2) \vee E x_1$
 - ▶ $\forall y, (ev^{-1} y) \subseteq E \rightarrow T y_0 y$
- ▶ Quasi morphisms can be ext. to relational maps
 - ▶ requires several extra (technical) assumptions
 - ▶ used in [@GH/DmxLarchey/Kruskal-Veldman](#)

Quasi morphisms: the decidable case

- ▶ This case is easy to understand, but less general
- ▶ Assuming T_{y_0} and E are decidable:
 - ▶ $\forall y : Y, T_{y_0} y \vee_t \neg T_{y_0} y$
 - ▶ $\forall x : X, E x \vee_t \neg E x$

Quasi morphisms: the decidable case

- ▶ This case is easy to understand, but less general
- ▶ Assuming $T y_0$ and E are decidable:
 - ▶ $\forall y : Y, T y_0 y \vee_t \neg T y_0 y$
 - ▶ $\forall x : X, E x \vee_t \neg E x$
- ▶ Surj. rel. morph. from $R \Downarrow (\neg E)$ to $T \Downarrow (\neg T y_0)$
 - ▶ rel. morph.: $\lambda x y, \pi_1(\text{ev } x) = \pi_1 y$
 - ▶ surj. by finitary choice over $\text{ev}^{-1} y$ for E

Quasi morphisms: the decidable case

- ▶ This case is easy to understand, but less general
- ▶ Assuming $T \uparrow y_0$ and E are decidable:
 - ▶ $\forall y : Y, T \uparrow y_0 y \vee_t \neg T \uparrow y_0 y$
 - ▶ $\forall x : X, E x \vee_t \neg E x$
- ▶ Surj. rel. morph. from $R \Downarrow(\neg E)$ to $T \Downarrow(\neg T \uparrow y_0)$
 - ▶ rel. morph.: $\lambda x y, \pi_1(\text{ev } x) = \pi_1 y$
 - ▶ surj. by finitary choice over $\text{ev}^{-1} y$ for E
- ▶ But $\text{af } R \rightarrow \text{af } (R \Downarrow(\neg E))$ (always)
- ▶ And $\text{af } R \Downarrow(\neg T \uparrow y_0) \rightarrow \text{af } T \uparrow y_0$ (by dec.)
- ▶ Hence $\text{af } R \rightarrow \text{af } T \uparrow y_0$

Quasi morphisms: the general case

- ▶ No dec. assumption on $T y_0$ nor on E
 - ▶ This case is not trivial
- ▶ The full argument in the artifact

Quasi morphisms: the general case

- ▶ No dec. assumption on $T y_0$ nor on E
 - ▶ This case is not trivial
- ▶ The full argument in the artifact
- ▶ We just introduce the tools involved:
 - ▶ Bar inductive predicates and good lists
 - ▶ The FAN theorem for inductive bars
 - ▶ A finitary combinatorial principle

The FAN theorem for inductive bars

- ▶ The product embedding for lists for $R : X \rightarrow Y \rightarrow \text{Prop}$
- ▶ $\text{Forall}_2 R : \text{list } X \rightarrow \text{list } Y \rightarrow \text{Prop}$

$$\frac{}{\text{Forall}_2 R [] []} \qquad \frac{R \ x \ y \quad \text{Forall}_2 R \ l \ m}{\text{Forall}_2 R \ (x :: l) \ (y :: m)}$$

- ▶ define $\text{FAN } l/w \doteq \lambda c, \text{Forall}_2 (\cdot \in \cdot) c \ l/w$
 - ▶ collects finitely many choices sequences

$$[c_1; \dots; c_n] \in \text{FAN } [w_1; \dots; w_n] \iff c_1 \in w_1, \dots, c_n \in w_n$$

The FAN theorem for inductive bars

- ▶ The product embedding for lists for $R : X \rightarrow Y \rightarrow \text{Prop}$
- ▶ $\text{Forall}_2 R : \text{list } X \rightarrow \text{list } Y \rightarrow \text{Prop}$

$$\frac{}{\text{Forall}_2 R [] []} \qquad \frac{R \ x \ y \quad \text{Forall}_2 R \ l \ m}{\text{Forall}_2 R \ (x :: l) \ (y :: m)}$$

- ▶ define $\text{FAN } lw \equiv \lambda c, \text{Forall}_2 (\cdot \in \cdot) c \ lw$
 - ▶ collects finitely many choices sequences

$$[c_1; \dots; c_n] \in \text{FAN } [w_1; \dots; w_n] \leftrightarrow c_1 \in w_1, \dots, c_n \in w_n$$

- ▶ FAN theorem for $P : \text{rel}_1 (\text{list } X)$ (Fridlender 99)
 - ▶ if *monotonic*: $\forall x \ l, P \ l \rightarrow P \ (x :: l)$
 - ▶ then $\text{bar } P \ [] \rightarrow \text{bar } (\lambda lw, \text{FAN } lw \subseteq P) \ []$
- ▶ mono. predicates bound to be met uniformly /FAN

Finitary choice principles

- ▶ Finite one dimensional choice:
 - ▶ for $F, P, Q : \text{rel}_1 X$
 - ▶ if $\text{fin } F$ and $F \subseteq P \cup Q$
 - ▶ then $F \subseteq P$ or $\exists x, F x \wedge Q x$

Finitary choice principles

- ▶ Finite one dimensional choice:
 - ▶ for $F, P, Q : \text{rel}_1 X$
 - ▶ if $\text{fin } F$ and $F \subseteq P \cup Q$
 - ▶ then $F \subseteq P$ or $\exists x, F x \wedge Q x$
- ▶ Finite two dimensional choice:
 - ▶ for $P : \text{rel}_1 (\text{list } X)$, $B : \text{rel}_1 X$, and $lw : \text{list } (\text{list } X)$
 - ▶ assuming $\forall c, \text{FAN } lw \ c \rightarrow P \ c \vee \exists x, x \in c \wedge B \ x$
 - ▶ any choice sequence satisfies P or meets B
 - ▶ we have either:
 - ▶ $\exists c, \text{FAN } lw \ c \wedge P \ c$ (P contains a choice sequence)
 - ▶ or $\exists w, w \in lw \wedge w \subseteq B$ (B is unavoidable)

Bounding search

From Almost Full to Well Founded

- ▶ Induction principle from (Vytiniostis *et al.* 2012)

$$\text{af } R \rightarrow T^+ \cap R^{-1} \subseteq \emptyset \rightarrow \text{well_founded } T$$

- ▶ small examples in *Stop when you are almost full...*

From Almost Full to Well Founded

- ▶ Induction principle from (Vytiniostis *et al.* 2012)

$$\text{af } R \rightarrow T^+ \cap R^{-1} \subseteq \emptyset \rightarrow \text{well_founded } T$$

- ▶ small examples in *Stop when you are almost full...*
- ▶ larger example: Karp-Miller (Yamamoto *et al.* 17)
 - ▶ deciding coverability for Petri nets
- ▶ revisited at [@GH/DmxLarchey/Karp-Miller](#)
 - ▶ decision: a covering or its impossibility
 - ▶ refined: Karp-Miller tree with accel. transitions

Bounding search using Almost Fullness

- ▶ A constructive König's lemma:
 - ▶ for $R : \text{rel}_2 X$ with **af** R
 - ▶ and $P : \mathbb{N} \rightarrow \text{rel}_1 X$ with $\forall n, \text{fin}(P n)$

$$\exists_t m, \forall v : X^m, (\forall i, P \underline{i} v_i) \rightarrow \exists i < j, R v_i v_j$$

- ▶ P as a finitely branching search space

Bounding search using Almost Fullness

- ▶ A constructive König's lemma:
 - ▶ for $R : \text{rel}_2 X$ with **af** R
 - ▶ and $P : \mathbb{N} \rightarrow \text{rel}_1 X$ with $\forall n, \text{fin}(P n)$

$$\exists_t m, \forall v : X^m, (\forall i, P \ i \ v_i) \rightarrow \exists i < j, R \ v_i \ v_j$$

- ▶ P as a finitely branching search space
- ▶ is m obtained via bar $P []$ and the FAN theorem
- ▶ Coq proof here: [@GH/DmxLarchey/Kruskal-FAN](#)

Bounding search using Almost Fullness
