Outline of the talk

1 Biological motivations and the combinatorial model

2 Previous results: the whole genome duplication - random loss model

3 Some combinatorial properties of the classes C(K, 1) and C(K, p)

4 Other questions to be considered

Mathilde Bouvel

Biological motivations and the combinatorial model

Duplications and losses in the biological models of genome rearrangement

- Complete genome sequences at disposal:
- \hookrightarrow study molecular evolution and compute distance between genomes
 - Classical models of genome rearrangement:
- \hookrightarrow duplications and losses of genes not taken into account
 - On the tandem duplication-random loss model of genome rearrangement [2005]:
- → Chaudhuri, Chen, Mihaescu and Rao isolate the duplication-loss problem

Biological motivations and the combinatorial model

The tandem duplication - random loss model

$$\mathsf{Genes} = \{1, 2, \dots, n\}$$
; $\mathsf{Genome} = \mathsf{Permutation} \ \sigma \in S_n$

ilts

Definition

One tandem duplication - random loss step:

- duplication of a contiguous fragment of the genome, inserted immediately after the original fragment
- 2 loss of one of the two copies of every duplicated gene

12 34567 ~ 12 3456 34567 ~ 12 × 12 × 5 × 67 ~ 12 × 5 × 67 ~ 12 × 5 × 67

Mathilde Bouvel

Motivations and the model

Previous results

Combinatorial properties

Other questions

Biological motivations and the combinatorial model

The tandem duplication - random loss model

Example

$$12 \overline{34567} \longrightarrow 12 \overline{3456} \overline{34567} \longrightarrow 12 \overline{34567} \longrightarrow 12 \overline{34567} \longrightarrow 12 \overline{4567} \longrightarrow 12 \overline{45367}$$

Beware ! Duplication-loss steps are not reversible !

Example $123456 \rightarrow 246135 \not > 123456$

Previous results: the whole genome dup	lication - random loss model		

Duplication-loss from the pattern-avoidance point of view

For the whole genome duplication - random loss model:

Theorem	
$cost(\sigma) = \lceil \log_2(desc(\sigma) + 1) \rceil$	

Consequence

The permutations obtainable in p steps are those having at most $2^p - 1$ descents.

 \implies a pattern-avoiding permutation class S(B), with B = the minimal permutations (for \prec) with 2^p descents.

 \prec is the pattern involvement relation

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties ●○○○○○○○	Other questions
Some combinatorial properties of	of the classes $\mathcal{C}(K,1)$ and $\mathcal{C}(K,\mu)$)	

The variant of the model we considered

Piecewise constant cost function: width
$$k \Rightarrow \text{cost} \begin{cases} 1 \text{ if } k \leq K \\ \infty \text{ if } k > K \end{cases}$$

Alternatively: Duplication of fragments of width at most KCost = number of steps

Problems to consider:

- Characterization of the permutations obtained in p steps in terms of excluded patterns ?
- Cost of obtaining a permutation ? on average ? in the worst case ?
- Finding an optimal sequence of steps from 12... n to σ, i.e. a sequence of minimal cost ?

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions
Some combinatorial properties of the c	lasses $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$		

Definition

Definition

C(K, p) = the class of all permutations obtained from 12... *n* (for any *n*) after *p* duplication-loss steps of width at most *K*.

Notice: $\mathcal{C}(K, p)$ is stable for \prec

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions
Some combinatorial properties of the classes $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$			

First theorem

Focus on C(K, 1): one duplication-loss step from $12 \dots n$

Theorem

 $\mathcal{C}(K,1)=S(B).$

The basis *B* is $\{321, 3142, 2143\} \cup D$, *D* being the set of all permutations of S_{K+1} that do not start with 1 nor end with K + 1, and containing exactly one descent.

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions
Some combinatorial properties of the c	lasses $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$		

An important property

Notice: $\sigma \in \mathcal{C}(K, 1) \Rightarrow desc(\sigma) \le 1$ $|\sigma| \le K, desc(\sigma) \le 1 \Rightarrow \sigma \in \mathcal{C}(K, 1)$

Proposition

For the permutations σ of size K + 1 having exactly one descent we have: $\sigma \notin C(K, 1) \Leftrightarrow \sigma$ does not start with 1 nor end with K + 1.

$\sigma \in S_{K+1}$ with 1 descent

 $\sigma = 1\sigma_2 \dots \sigma_{K+1} \text{ or } \sigma = \sigma_1 \dots \sigma_K K + 1 \Rightarrow \sigma \in \mathcal{C}(K, 1)$ $\sigma_1 \neq 1 \text{ and } \sigma_{K+1} \neq K + 1 \Rightarrow \sigma \notin \mathcal{C}(K, 1)$

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions
Some combinatorial properties of the c	lasses $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$		

An important property

Notice: $\sigma \in \mathcal{C}(K, 1) \Rightarrow desc(\sigma) \le 1$ $|\sigma| \le K, desc(\sigma) \le 1 \Rightarrow \sigma \in \mathcal{C}(K, 1)$

Proposition

For the permutations σ of size K + 1 having exactly one descent we have: $\sigma \notin C(K, 1) \Leftrightarrow \sigma$ does not start with 1 nor end with K + 1.

$$\sigma \in S_{K+1} \text{ with 1 descent}$$

$$\sigma = 1\sigma_2 \dots \sigma_{K+1} \text{ or } \sigma = \sigma_1 \dots \sigma_K K + 1 \Rightarrow \sigma \in \mathcal{C}(K, 1)$$

$$\sigma_1 \neq 1 \text{ and } \sigma_{K+1} \neq K + 1 \Rightarrow \sigma \notin \mathcal{C}(K, 1)$$

		00000000	
Some combinatorial properties of the c	lasses $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$		

Is $\mathcal{C}(K, p)$ also a pattern-avoiding class ?

Theorem

The class C(K, p) is a class of pattern-avoiding permutations S(B). Its basis B is finite and contains only patterns of size at most $(Kp + 2)^2 - 2$.

C(K, p) is stable for the pattern relation \prec \Rightarrow show that the basis is finite + bound the size of the patterns

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions
		00000000	
Some combinatorial properties of the classes $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$			

Key Proposition to the Theorem

Proposition

If $\sigma \notin C(K, p)$, then either $|\sigma| \leq (Kp + 2)^2 - 2$, or there exists a strict pattern τ of σ , $\tau \notin C(K, p)$.

 ${\sf Proposition} \Rightarrow {\sf Theorem: \ stability \ for} \prec$

Idea of the proof of the Proposition: Consider the minimal permutations $\sigma \notin C(K, p)$, and bound the necessary moves of elements to go from $12 \dots n$ to σ

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties ○○○○○○●○	Other questions
Some combinatorial properties of the classes $\mathcal{C}(K,1)$ and $\mathcal{C}(K,p)$			

vp-vectors and vp-domain

Represents the necessary moves from σ to 12...n, or when reversing the arrows from 12...n to σ

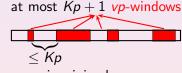

If $\sigma \in \mathcal{C}(K, p)$, then its *vp*-domain contains at most *Kp* elements

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties ○○○○○○●	Other questions
Some combinatorial properties of the cl	asses $\mathcal{C}(K, 1)$ and $\mathcal{C}(K, p)$		

What does minimal $\sigma \notin C(K, p)$ look like ?

Previously: If $\sigma \in C(K, p)$, then its *vp*-domain contains at most Kp elements Consequence: If $\sigma \notin C(K, p)$ is minimal, then its *vp*-domain contains at most 2Kp + 2 elements

because σ is minimal

Conclusion: $|\sigma| \leq (Kp+2)Kp + 2Kp + 2 = (Kp+2)^2 - 2$

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions ●○
Other questions to be considered			

How many steps from $12 \dots n$ to σ ?

Duality between "long moves" and "local reordering"

- Lower bound: $\Omega(\frac{n}{K} \log K + \frac{n^2}{K^2})$ steps in the worst case and on average
- Algorithm (upper bound): $\Theta(\frac{n}{K} \log K + \frac{n^2}{K^2})$ steps in the worst case and on average

What about $cost(\sigma)$? Our algorithm gives an *K*-approximation of an optimal duplication-loss scenario

Mathilde Bouvel

Motivations and the model	Previous results	Combinatorial properties	Other questions ○●
Other questions to be considered			

Open questions

Algorithmic:

- Formula for $cost(\sigma)$?
- Optimal sequence of steps from $12 \dots n$ to σ ?
- Characterization of those sequences ? with a decreasing energy function ?

Combinatorics:

- Characterization of the minimal permutations with d = 2^p descents (excluded patterns for the whole genome duplication - random loss model) ?
- Description of the excluded patterns in C(K, p) ?
- Order of the cardinality of C(K, 1) and C(K, p)?

Biology:

How can the knowledge of pattern-avoidance be of use to compute probable evolution scenarios ?

Mathilde Bouvel
