 3. Development
 4. Testing → *Product delivery*
 5. Maintenance→ Waterfall method
- Good communication during the project between the different people working on it;
- Adaptability : if the customer don't like the design when the product is delivered ? How bad is it ? Do you go to court ? Are you able to change it, without any more costs ?

The V-method

Pros and Cons

Advantages:

- Possibility to go backwards;
- Able to see when a problem occurs;

Disadvantages:

- Big steps/blocks → small adaptability (delays, requirement change, etc.);
- Communications between the parties is limited;
- Measurement of the progression is complicated;

Agile method : idea

- Structure the project in some small iterations:
First iteration → test it → when it works, second iteration, etc.;

Agile method : idea

- Structure the project in some small iterations:
First iteration → test it → when it works, second iteration, etc.;
- Idea of minimum viable product;
Example: "I need a personal transport"

Not like this....

Like this!

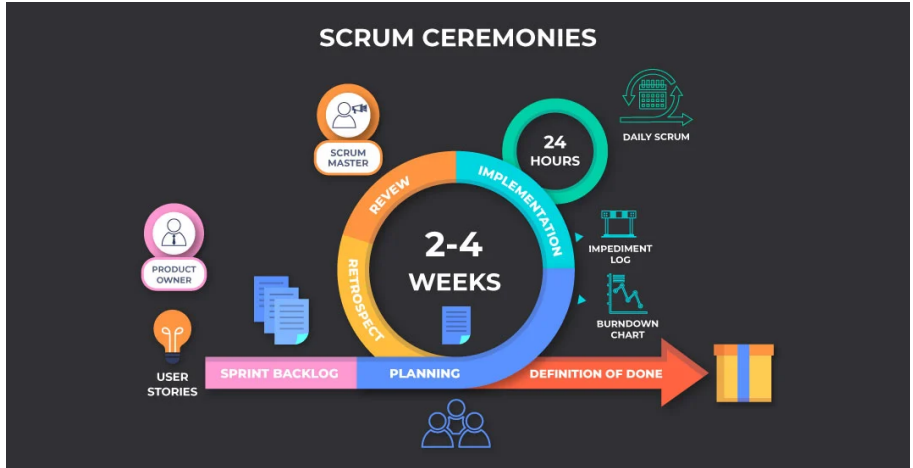

Agile principles¹

- Individuals and interactions *over processes and tools*;
- Working software *over comprehensive documentation*;
- Customer collaboration *over contract negotiation*;
- Responding to change *over following a plan*;
- Regular delivery to the client of product increments;
- Daily communication between all parties;

Scrum

Backlogs

Product Backlog (→ *general*)

Sprint Backlog (→ *only for the current sprint*)

Backlogs

Product Backlog (→ *general*)

- List of product requirements (ordered by implementability and priority);
- Effort/complexity estimation;
- Added value.

Sprint Backlog (→ *only for the current sprint*)

Backlogs

Product Backlog (→ *general*)

- List of product requirements (ordered by implementability and priority);
- Effort/complexity estimation;
- Added value.

Sprint Backlog (→ *only for the current sprint*)

- List of user stories (*i.e.*, tasks to be performed during the sprint, doable by one person) with:
 - Description of (sub-)features;
 - Criteria of acceptance;
- Chosen/refined from Product Backlog;
- Status: Ready, Ongoing, Done, Blocked.

Roles

Scrum Master

Product Owner

Development Team

Roles

Scrum Master

- Organizes and supervises meetings (*daily scrum*);
- Watches over problems, oversees difficulties, encourages cooperation;
- Checks progress of the sprint (→ update backlog status).

Product Owner

Development Team

Roles

Scrum Master

- Organizes and supervises meetings (*daily scrum*);
- Watches over problems, oversees difficulties, encourages cooperation;
- Checks progress of the sprint (→ update backlog status).

Product Owner

- Define project orientation;
- Must know the requirements and priorities;
- Manages Product Backlog and add/remove/update User stories;
- Validate product increments.

Development Team

Roles

Scrum Master

- Organizes and supervises meetings (*daily scrum*);
- Watches over problems, oversees difficulties, encourages cooperation;
- Checks progress of the sprint (→ update backlog status).

Product Owner

- Define project orientation;
- Must know the requirements and priorities;
- Manages Product Backlog and add/remove/update User stories;
- Validate product increments.

Development Team

- No fix roles;
- Self-organized;
- Stable during a Sprint.

Advantages and good practices

Advantages

- Iterative and incremental method;
- Daily meetings (progress recap, problem detection, problem solving);
- Self-organized, but some referents if needed;
- Testing in software development.

Good practices

- Define each sprint properly (sprint goal, user stories, etc.);
- Documentation;
- Communication.

Some tools are often used, like Trello or Slack.

Conclusion

→ The main problem :

1
How the customer explained it

2
How the project leader understood it

3
How the analyst designed it

4
How the programmer wrote it

5
What the beta testers received

6
How the business consultant described it

7
