

Computational Geometry Algorithms Library

Pierre Alliez
INRIA

Andreas Fabri
GeometryFactory

Efi Fogel
Tel Aviv University

Mission Statement

“Make the large body of geometric algorithms developed in the field of computational geometry available for industrial applications”

CGAL Project Proposal, 1996

Algorithms and Datastructures

Bounding Volumes

Polyhedral Surface

BooleanOperations

Triangulations

Voronoi Diagrams

Mesh Generation

Subdivision

Simplification

Parametrisation

Streamlines

Ridge Detection

Neighbor Search

Kinetic Datastructures

Lower Envelope

Arrangement

Intersection Detection

Minkowski Sum

PCA

Polytope distance

QP Solver

CGAL in Numbers

500,000 lines of C++ code

10,000 downloads/year (+ Linux distributions)

3,500 manual pages

3,000 subscribers to cgal-announce

1,000 subscribers to cgal-discuss

120 packages

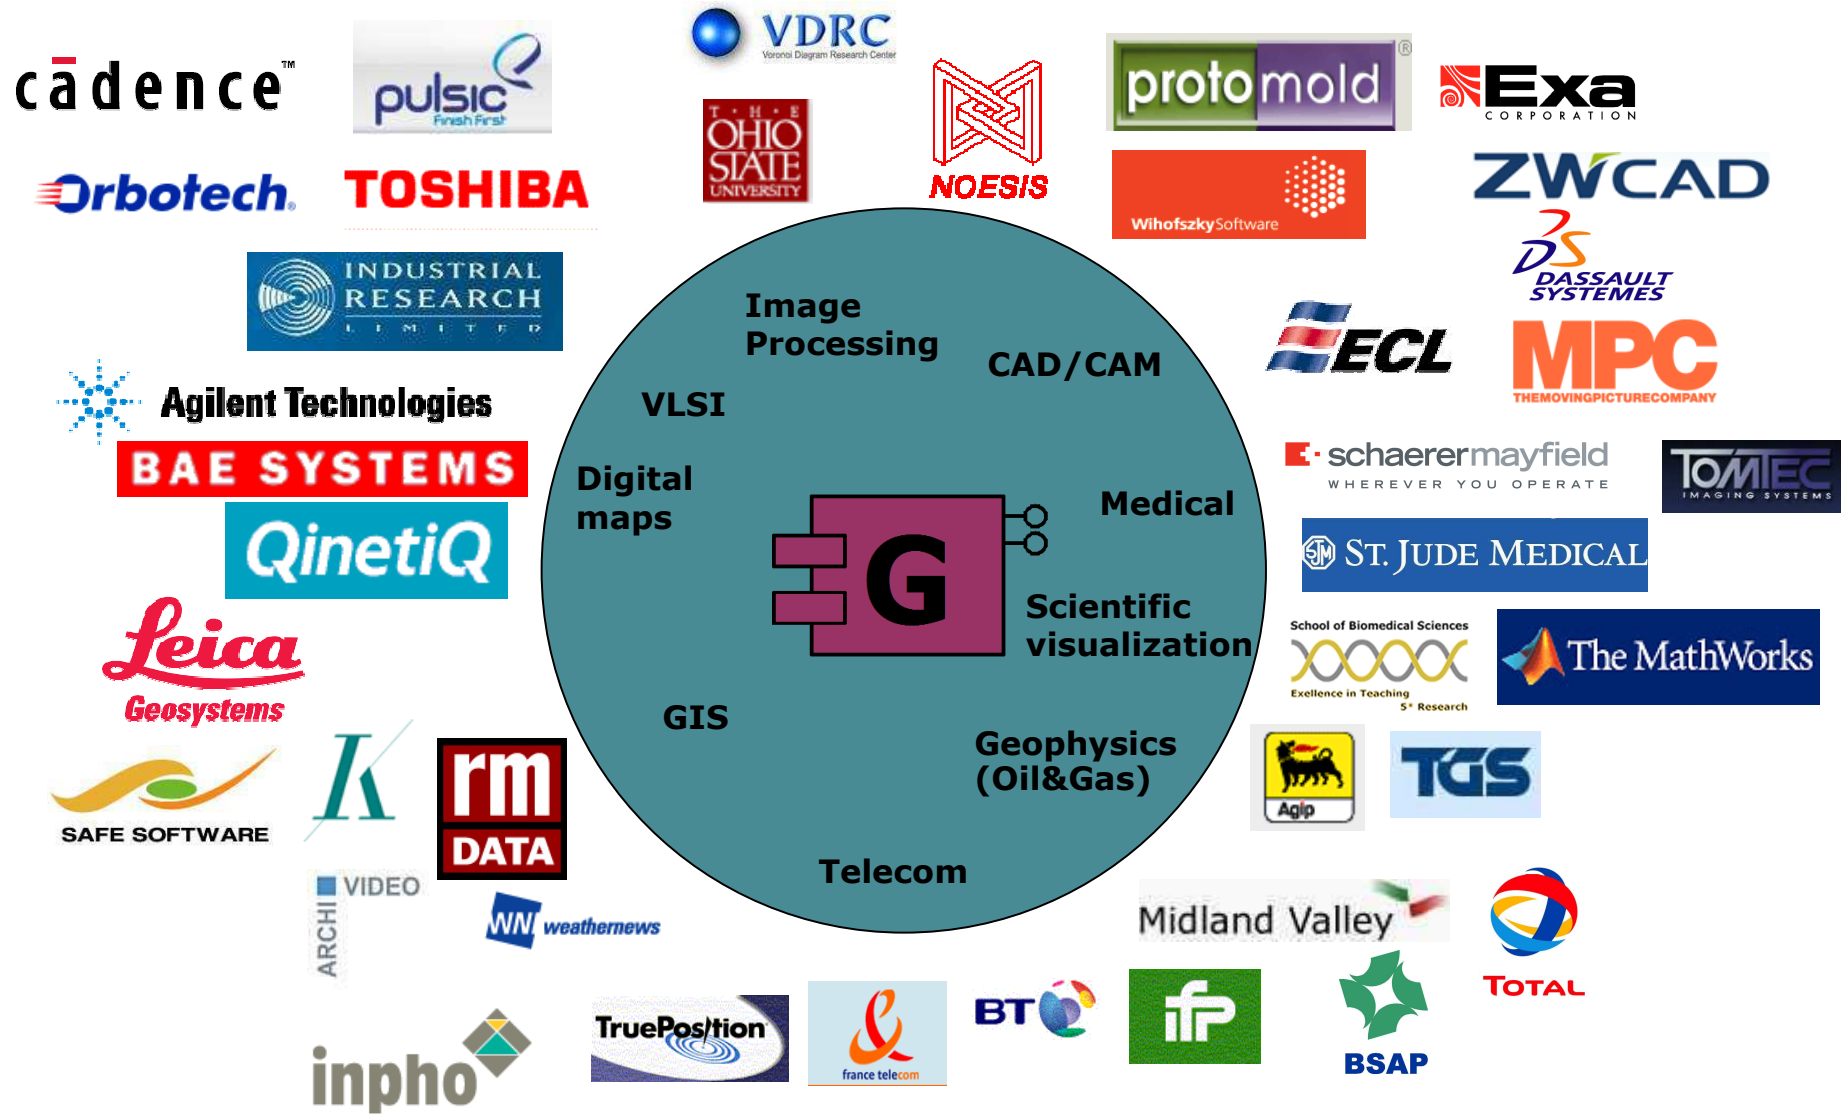

60 commercial users

20 active developers

12 months release cycle

2 licenses: Open Source and commercial

Some Commercial Users

Why They Use CGAL

“ I recommended to the senior management that we start a policy of buying-in as much functionality as possible to reduce the quantity of code that our development team would have to maintain.

This means that we can concentrate on the application layer and concentrate on our own problem domain.”

Senior Development Engineer
& Structural Geologist

Midland Valley Exploration

Why They Use CGAL

“ My research group JYAMITI at the Ohio State University uses CGAL because it provides an efficient and robust code for Delaunay triangulations and other primitive geometric predicates. Delaunay triangulation is the building block for many of the shape related computations that we do. [...]”

Without the robust and efficient codes of CGAL, these codes could not have been developed. ”

Tamal Dey
Professor, Ohio State University

CGAL Open Source Project

Project = « Planned Undertaking »

- Institutional members make a long term commitment: Inria, MPI, Tel-Aviv U, Utrecht U, Groningen U, ETHZ, GeometryFactory, FU Berlin, Forth, U Athens
- Editorial Board
 - Steers and animates the project
 - Reviews submissions
- Development Infrastructure
 - Gforge: svn, tracker, nightly testsuite,...
 - 120p developer manual and mailing list
 - Two 1-week developer meetings per year

Contributions

- Submission of specifications of new contributions
- Review and decision by the Editorial Board
- Value for contributor
 - Integration in the CGAL community
 - Gain visibility in a mature project
 - Publication value for accepted contributions

Exact Geometric Computing

Predicates and Constructions

Predicates

orientation

in_circle

Constructions

intersection

circumcenter

Robustness Issues

- Naive use of floating-point arithmetic causes geometric algorithms to:
 - Produce [slightly] wrong output
 - Crash after invariant violation
 - Infinite loop
- There is a gap between
 - Geometry in theory
 - Geometry with floating-point arithmetic

Geometry in Theory

$$\text{ccw}(s,q,r) \ \& \ \text{ccw}(p,s,r) \ \& \ \text{ccw}(p,q,s) \ \Rightarrow \ \text{ccw}(p,q,r)$$

Correctness proofs of algorithms rely on such theorems

The Trouble with Double

$$\text{orientation}(p,q,r) = \text{sign}((p_x-r_x)(q_y-r_y)-(p_y-r_y)(q_x-r_x))$$

Exact Geometric Computing [Yap]

Make sure that the control flow in the implementation corresponds to the control flow with exact real arithmetic

Filtered Predicates

- Generic functor adaptor `Filtered_predicate<>`
 - Try the predicate instantiated with intervals
 - In case of uncertainty, evaluate the predicate with multiple precision arithmetic
- Refinements:
 - Static error analysis
 - Progressively increase precision

Filtered Constructions

Lazy number = interval and arithmetic expression tree

$$(3.2 + 1.5) * 13$$

Lazy object = approximated object and geometric operation tree

Test that may trigger an exact re-evaluation:

$$\text{if } (n' < m')$$

$$\text{if } (\text{collinear}(a', m', b'))$$

The User Perspective

- Convenience Kernels
 - `Exact_predicates_inexact_constructions_kernel`
 - `Exact_predicates_exact_constructions_kernel`
 - `Exact_predicates_exact_constructions_kernel_with_sqrt`
- Number Types
 - `double`, `float`
 - `CGAL::Gmpq` (rational), `Core` (algebraic)
 - `CGAL::Lazy_exact_nt<ExactNT>`
- Kernels
 - `CGAL::Cartesian<NT>`
 - `CGAL::Filtered_kernel<Kernel>`
 - `CGAL::Lazy_kernel<NT>`

Merits and Limitations

- Ultimate robustness inside the black box
- The time penalty is reasonable, e.g. 10% for 3D Delaunay triangulation of 1M random points
- Limitations of Exact Geometric Computing
 - Topology preserving rounding is non-trivial
 - Construction depth must be reasonable
 - Cannot handle trigonometric functions

Generic Programming

STL Genericity

```
template <class Key, class Less>
class set {
    Less less;

    insert(Key k)
    {
        if (less(k, treenode.key))
            insertLeft(k);
        else
            insertRight(k);
    }
};
```

CGAL Genericity

```
template < class Geometry >
class Delaunay_triangulation_2 {
    Geometry::Orientation orientation;
    Geometry::In_circle in_circle;

    void insert(Geometry::Point t) {
        ...
        if(in_circle(p,q,r,t)) {...}
        ...
        if(orientation(p,q,r){...}
    }
};
```

CGAL Genericity

```
template < class Geometry, class TDS >  
class Delaunay_triangulation_2 {  
  
};
```

```
template < class Vertex, class Face >  
class Triangulation_data_structure_2 {  
  
};
```

Iterators

```
template <class Geometry>
class Delaunay_triangulation_2 {

    typedef .. Vertex_iterator;
    typedef .. Face_iterator;

    Vertex_iterator vertices_begin();
    Vertex_iterator vertices_end();

    template <class OutputIterator>
    incident_faces(Vertex_handle v, OutputIterator it);
};

std::list<Face_handle> faces;
dt.incident_faces(v, std::back_inserter(faces));
```

Iterators

```
template <class Geometry>
class Delaunay_triangulation_2 {

    template <class T>
    void insert(T begin, T end); // typedef(*begin)==Point
};

list<Kernel::Point_2> points;

Delaunay_triangulation<Kernel> dt;

dt.insert(points.begin(), points.end());
```
