Definition

A verifiable delay function (VDF) is a function that

- 1. takes T steps to evaluate, even with unbounded parallelism
- 2. the output can be verified efficiently.

Definition

A verifiable delay function (VDF) is a function that

- 1. takes T steps to evaluate, even with unbounded parallelism
- 2. the output can be verified efficiently.
- Setup $(\lambda, T) \longrightarrow$ public parameters *pp*
- Eval $(pp, x) \longrightarrow$ output y, proof π (requires T steps)
- Verify $(pp, x, y, \pi) \longrightarrow$ yes or no.

Definition

A verifiable delay function (VDF) is a function that

- 1. takes T steps to evaluate, even with unbounded parallelism
- 2. the output can be verified efficiently.
- Setup $(\lambda, T) \longrightarrow$ public parameters pp
- Eval $(pp, x) \longrightarrow$ output y, proof π (requires T steps)
- Verify $(pp, x, y, \pi) \longrightarrow$ yes or no.

Uniqueness If $Verify(pp, x, y, \pi) = Verify(pp, x, y', \pi') = yes$, then y = y'.

Correctness The verification will always succeed if Eval has been computed honestly. Soundness A lying evaluator will always fail the verification.

Sequentiality It is impossible to correctly evaluate the VDF in time less than T - o(T), even when using poly(T) parallel processors.

Idea: slow things down by adding delay.

◆□ → < □ → < Ξ → < Ξ → Ξ · の Q · 4/18</p>

$$\forall x \in \langle g \rangle, \qquad f(x) = \log_g(x)$$

Verification is easy: $g^{f(x)} \stackrel{?}{=} x$. You can parallelize to compute f(x).

$$\forall x \in \langle g \rangle, \qquad f(x) = \log_g(x)$$

Verification is easy: $g^{f(x)} \stackrel{?}{=} x$. You can parallelize to compute f(x).

► VDF without "verifiability": composition of hash functions.

$$\forall x \in \langle g \rangle, \qquad f(x) = \log_g(x)$$

Verification is easy: $g^{f(x)} \stackrel{?}{=} x$. You can parallelize to compute f(x).

► VDF without "verifiability": composition of hash functions.

$$f(x) = h^{(T)}(x)$$

You need to recompute f(x) to verify.

$$\forall x \in \langle g \rangle, \qquad f(x) = \log_g(x)$$

Verification is easy: $g^{f(x)} \stackrel{?}{=} x$. You can parallelize to compute f(x).

▶ VDF without "verifiability": composition of hash functions.

$$f(x) = h^{(T)}(x)$$

You need to recompute f(x) to verify.

▶ VDF without "no parallelization": pre-image of a hash function.

$$\forall x \in \langle g \rangle, \qquad f(x) = \log_g(x)$$

Verification is easy: $g^{f(x)} \stackrel{?}{=} x$. You can parallelize to compute f(x).

VDF without "verifiability": composition of hash functions.

$$f(x) = h^{(T)}(x)$$

You need to recompute f(x) to verify.

▶ VDF without "no parallelization": pre-image of a hash function.

$$f(x) = h^{-1}(x)$$

Verification is easy: $h(f(x)) \stackrel{?}{=} x$. Computation is faster as long as you parallelize.

Setup. *N* is a RSA modulus, public parameters: $(\mathbb{Z}/N\mathbb{Z}, H : \{0, 1\}^* \to \mathbb{Z}/N\mathbb{Z})$.

Setup. *N* is a RSA modulus, public parameters: $(\mathbb{Z}/N\mathbb{Z}, H : \{0, 1\}^* \to \mathbb{Z}/N\mathbb{Z})$. Evaluation. $y = H(x)^{2^T} \mod N$, and π a proof.

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

Example (Frobenius) For $A, B \in \overline{\mathbb{F}}_{p}$,

$$\pi_p: E: y^2 = x^3 + Ax + B \longrightarrow E^{(p)}: y^2 = x^3 + A^p x + B^p$$
$$(x, y) \longmapsto (x^p, y^p)$$

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

Example (Frobenius)

For $A, B \in \overline{\mathbb{F}}_p$,

$$\pi_p: E: y^2 = x^3 + Ax + B \longrightarrow E^{(p)}: y^2 = x^3 + A^p x + B^p$$

$$(x, y) \longmapsto (x^p, y^p)$$

Vélu's formulas. For $P \in E(\overline{\mathbb{F}}_p)$ of order ℓ coprime with p, we have formulas for computing an isogeny φ of kernel $\langle P \rangle$. The degrees of the polynomials defining φ is $O(\ell)$.

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

Example (Frobenius)

For $A, B \in \overline{\mathbb{F}}_p$,

$$\pi_p: E: y^2 = x^3 + Ax + B \longrightarrow E^{(p)}: y^2 = x^3 + A^p x + B^p$$

$$(x, y) \longmapsto (x^p, y^p)$$

Vélu's formulas. For $P \in E(\overline{\mathbb{F}}_p)$ of order ℓ coprime with p, we have formulas for computing an isogeny φ of kernel $\langle P \rangle$. The degrees of the polynomials defining φ is $O(\ell)$.

In practice, Vélu's formulas are efficient for very small kernel.

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

Example (Frobenius)

For $A, B \in \overline{\mathbb{F}}_p$,

$$\pi_p: E: y^2 = x^3 + Ax + B \longrightarrow E^{(p)}: y^2 = x^3 + A^p x + B^p$$

$$(x, y) \longmapsto (x^p, y^p)$$

Vélu's formulas. For $P \in E(\overline{\mathbb{F}}_p)$ of order ℓ coprime with p, we have formulas for computing an isogeny φ of kernel $\langle P \rangle$. The degrees of the polynomials defining φ is $O(\ell)$.

In practice, Vélu's formulas are efficient for very small kernel. From $\varphi : E \to E'$, there exists $\hat{\varphi} : E' \to E$ such that $\varphi \circ \hat{\varphi} = \hat{\varphi} \circ \varphi = [\deg \varphi]$.

An isogeny between two elliptic curves E and E' is an algebraic map φ such that $\varphi(0_E) = 0_{E'}$.

Example (Frobenius)

For $A, B \in \overline{\mathbb{F}}_p$,

$$\begin{aligned} \pi_p: & E: y^2 = x^3 + Ax + B & \longrightarrow & E^{(p)}: y^2 = x^3 + A^p x + B^p \\ & (x, y) & \longmapsto & (x^p, y^p) \end{aligned}$$

Vélu's formulas. For $P \in E(\bar{\mathbb{F}}_p)$ of order ℓ coprime with p, we have formulas for computing an isogeny φ of kernel $\langle P \rangle$. The degrees of the polynomials defining φ is $O(\ell)$.

In practice, Vélu's formulas are efficient for very small kernel. From $\varphi : E \to E'$, there exists $\hat{\varphi} : E' \to E$ such that $\varphi \circ \hat{\varphi} = \hat{\varphi} \circ \varphi = [\deg \varphi]$.

If E have a particular endomorphism ring, a shortcut can be found:

$$\begin{array}{cccc} E & \stackrel{\varphi}{\longrightarrow} & E' \\ \uparrow & & \uparrow \\ \operatorname{End}(E) = \mathcal{O} & \stackrel{I}{\xrightarrow{J}} & \mathcal{O}' = \operatorname{End}(E') \end{array}$$

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶

DLP over the curves.

P and *Q* of order *N* with $\log_2(N) \approx 256$.

$$\#E(\mathbb{F}_p)=p+1$$

so we set p = hN - 1 with h a cofactor.

- DLP over the finite field 𝔽_{p²}.
 NFS over 𝔽_{p²}: log₂(p) ≈ 1500. We need a cofactor of size log₂(h) ≈ 1250.
- Isogeny shortcut.

If E have a particular endomorphism ring, a shortcut can be found:

$$E \xrightarrow{\varphi} E'$$

$$\downarrow \qquad \uparrow$$
End(E) = $\mathcal{O} \xrightarrow{I}_{J} \mathcal{O}' = End(E')$

$$\downarrow \qquad \downarrow$$
E $\xrightarrow{\tilde{\varphi}}_{short deg} E'$

Suppose we have a point P of order 2^{T} defined over \mathbb{F}_{p} . It defines an isogeny of degree 2^{T} :

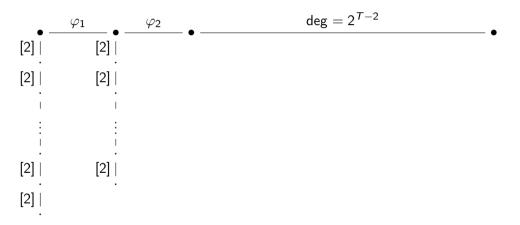

$$\deg(\varphi) = 2^{T}$$

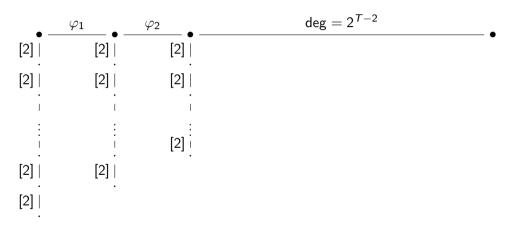

◆□ → ◆□ → ◆ ■ → ● ● ● ● ● ● 14/18

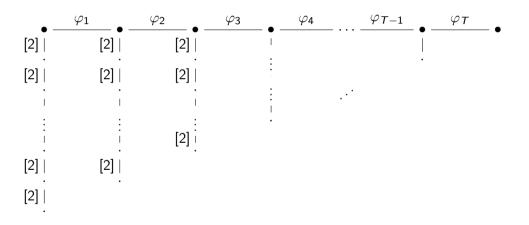

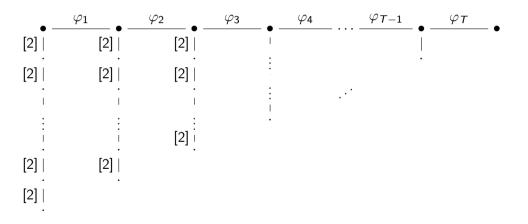

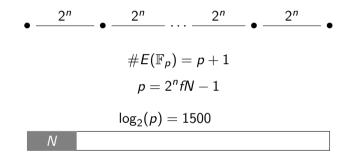

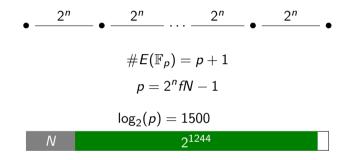

Suppose we have a point P of order 2^T defined over \mathbb{F}_p . It defines an isogeny of degree 2^T :

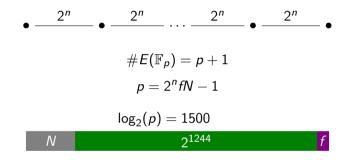

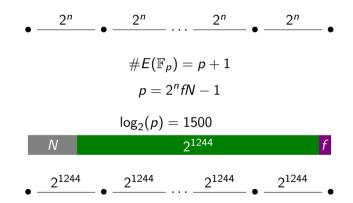

Complexity: $O(T^2)$. It can be turned into $O(T \log_2(T))$ with a recursive strategy.

We obtain an identification protocol where the secret can be sub-exponentially larger than the proof. But it is not zero-knowledge.
