## Definition

The Miller loop computes the function $f_{s, Q}$ such that $Q$ is a zero of order $s$, and $[s] Q$ is a pole of order 1, i.e

$$
\operatorname{div}\left(f_{s, Q}\right)=s(Q)-([s] Q)-(s-1) \mathcal{O}
$$

## Definition

For $P, Q \in E[r]$ such that $\pi_{p}(P)=P, \pi_{p}(Q)=[p] Q$,

$$
\operatorname{Tate}(P, Q):=f_{r, P}(Q)^{\left(p^{k}-1\right) / r} \quad \text { ate }(P, Q):=f_{t-1, Q}(P)^{\left(p^{k}-1\right) / r}

3 Timings and comparisons

An elliptic curve $E$ defined over $\mathbb{F}_{p}$ ，of trace $t$ and discriminant $D$ is pairing－friendly of embedding degree $k$ if
－$p, r$ are primes and $t$ is relatively prime to $p$
－$r$ divides $p+1-t$ and $p^{k}-1$ but does not divide $p^{i}-1$ for $1 \leq i<k$
－ $4 p-t^{2}=D y^{2}$ for a sufficiently small positive integer $D$ and an integer $y$ ．

An elliptic curve $E$ defined over $\mathbb{F}_{p}$, of trace $t$ and discriminant $D$ is pairing-friendly of embedding degree $k$ if

- $p, r$ are primes and $t$ is relatively prime to $p$
- $r$ divides $p+1-t$ and $p^{k}-1$ but does not divide $p^{i}-1$ for $1 \leq i<k$
- $4 p-t^{2}=D y^{2}$ for a sufficiently small positive integer $D$ and an integer $y$.

## Example.

Barreto-Naehrig curves are elliptic curves of embedding degree $k=12$, parametrized by

$$
\begin{gathered}
p(x)=36 x^{4}+36 x^{3}+24 x^{2}+6 x+1 \\
r(x)=36 x^{4}+36 x^{3}+18 x^{2}+6 x+1 \\
t(x)=6 x^{2}+1
\end{gathered}
$$

For some integer $x_{0},\left(p\left(x_{0}\right), r\left(x_{0}\right), t\left(x_{0}\right)\right)$ parametrizes a pairing-friendly elliptic curve.

composite $k$ and special $p \Longrightarrow$ 2016: STNFS attack
BN curves are threatened by STNFS...
Need a 5500 bits field $\mathbb{F}_{p^{12}}$ to get 128 bits of security.

Generation of curves with given prime $k$ ，square－free $D$ and no structure on $p$ ．
Algorithm：Cocks－Pinch $(k, D)$－Compute a pairing－friendly curve $E / \mathbb{F}_{p}$ of trace $t$ with a subgroup of order $r$ ，such that $t^{2}-D y^{2}=4 p$ ．

Set a prime $r$ such that $k \mid r-1$ and $\sqrt{-D} \in \mathbb{F}_{r}$
Set $T$ such that $r \mid \Phi_{k}(T)$
$t \leftarrow T+1$
$y \leftarrow(t-2) / \sqrt{-D}$
Lift $t, y \in \mathbb{Z}$ such that $t^{2}+D y^{2} \equiv 0 \bmod 4$
$p \leftarrow\left(t^{2}+D y^{2}\right) / 4$
if $p$ is prime then return $[p, t, y, r]$ else Repeat with another $r$ ．
