LICS'18  
University of Oxford  
9 July 2018

## Proto-Quipper-M

- We will consider several variants of a functional programming language called *Proto-Quipper-M* (renamed to ECLNL in our LICS paper).
  - We wanted to emphasize its dependence on enrichment in the name.

## Proto-Quipper-M

- We will consider several variants of a functional programming language called *Proto-Quipper-M* (renamed to ECLNL in our LICS paper).
  - We wanted to emphasize its dependence on enrichment in the name.
- Original language developed by Francisco Rios and Peter Selinger.
  - We present a more general abstract model.
- Language is equipped with formal denotational and operational semantics.
- Primary application is in quantum computing, but the language can describe arbitrary string diagrams.
- Original model does not support general recursion.
  - We extend the language with general recursion and prove soundness.

## Circuit Model

ECLNL is used to describe *families* of morphisms of an arbitrary, but fixed, symmetric monoidal category, which we denote  $\mathbf{M}$ .

### Example

If  $\mathbf{M} = \mathbf{FdCStar}$ , the category of finite-dimensional  $C^*$ -algebras and completely positive maps, then a program in our language is a family of quantum circuits.

### Example

$\mathbf{M}$  could also be a category of string diagrams which is freely generated.

# Circuit Model

## Example

Shor's algorithm for integer factorization may be seen as an infinite family of quantum circuits – each circuit is a procedure for factorizing an  $n$ -bit integer, for a fixed  $n$ .

Figure: Quantum Fourier Transform on  $n$  qubits (subroutine in Shor's algorithm).<sup>1</sup>

<sup>1</sup>Figure source: <https://commons.wikimedia.org/w/index.php?curid=14545612>

## Syntax of ECLNL calculus

The types of the language:

Types	$A, B ::= \alpha \mid 0 \mid A + B \mid I \mid A \otimes B \mid A \multimap B \mid !A \mid \text{Circ}(T, U)$
Intuitionistic types	$P, R ::= 0 \mid P + R \mid I \mid P \otimes R \mid !A \mid \text{Circ}(T, U)$
M-types	$T, U ::= \alpha \mid I \mid T \otimes U$

The term language:

Terms	$M, N ::= x \mid I \mid c \mid \text{let } x = M \text{ in } N$ $\mid \Box_A M \mid \text{left}_{A,B} M \mid \text{right}_{A,B} M \mid \text{case } M \text{ of } \{\text{left } x \rightarrow N \mid \text{right } y \rightarrow P\}$ $\mid * \mid M; N \mid \langle M, N \rangle \mid \text{let } \langle x, y \rangle = M \text{ in } N \mid \lambda x^A. M \mid MN$ $\mid \text{lift } M \mid \text{force } M \mid \text{box}_T M \mid \text{apply}(M, N) \mid (\tilde{I}, C, \tilde{I}')$
-------	---

## Example

### Example

$\text{qubit-copy} \equiv \lambda q^{\text{qubit}}. \langle q, q \rangle$

*Not* a well-typed program. Linear type checker will complain.

### Example

$\text{nat-copy} \equiv \lambda n^{\text{Nat}}. \langle n, n \rangle$

This is fine.

## Example

Assume  $H : Q \multimap Q$  is a constant representing the Hadamard gate.

### Example

two-hadamard :  $\text{Circ}(Q, Q)$

two-hadamard  $\equiv$  box lift  $\lambda q^Q. HHq$

A program which creates a completed circuit consisting of two  $H$  gates. The term is intuitionistic (can be copied, deleted).

## Our approach

- Describe an *abstract* categorical model for the same language.
- Describe an abstract categorical model for the language extended with recursion.

**Related work:** Rennela and Staton describe a different circuit description language, called EWire (based on QWire), where they also use enriched category theory.

## Linear/Non-Linear models

A Linear/Non-Linear (LNL) model as described by Benton is given by the following data:

- A cartesian closed category  $\mathbf{V}$ .
- A symmetric monoidal closed category  $\mathbf{C}$ .
- A symmetric monoidal adjunction:

### Remark

*An LNL model is a model of Intuitionistic Linear Logic.*

---

Nick Benton. *A mixed linear and non-linear logic: Proofs, terms and models.* CSL'94

## Models of the Enriched Effect Calculus

A model of the Enriched Effect Calculus (EEC) is given by the following data:

- A cartesian closed category  $\mathbf{V}$ , enriched over itself.
- A  $\mathbf{V}$ -enriched category  $\mathbf{C}$  with powers, copowers, finite products and finite coproducts.
- A  $\mathbf{V}$ -enriched adjunction:

### Theorem

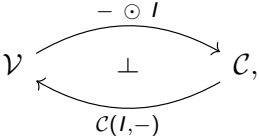

Every LNL model with additives determines an EEC model.

Egger, Møgelberg, Simpson. *The enriched effect calculus: syntax and semantics*. Journal of Logic and Computation 2012

## An abstract model for ECLNL

A model of ECLNL is given by the following data:

1. A cartesian closed category  $\mathbf{V}$  together with its self-enrichment  $\mathcal{V}$ , such that  $\mathcal{V}$  has finite  $\mathbf{V}$ -coproducts.
2. A  $\mathbf{V}$ -symmetric monoidal closed category  $\mathcal{C}$  with underlying category  $\mathbf{C}$  such that  $\mathcal{C}$  has finite  $\mathbf{V}$ -coproducts.

3. A  $\mathbf{V}$ -symmetric monoidal adjunction: 

where  $(- \odot I)$  denotes the  $\mathbf{V}$ -copower of the tensor unit in  $\mathcal{C}$ .

4. A symmetric monoidal category  $\mathbf{M}$  and a strong symmetric monoidal functor  $E : \mathbf{M} \rightarrow \mathbf{C}$ .

**Theorem:** Ignoring condition 4, an LNL model canonically induces a model of ECLNL.

# Soundness

## Theorem (Soundness)

*Every abstract model of ECLNL is computationally sound.*

## Concrete models of ECLNL

The original Proto-Quipper-M model is given by the LNL model: <sup>2</sup>

$$\begin{array}{ccc} & - \odot I & \\ \text{Set} & \xrightarrow{\quad} & \mathbf{Fam}[\overline{\mathbf{M}}] \\ & \perp & \\ & \xleftarrow{\quad} & \mathbf{Fam}[\overline{\mathbf{M}}](I, -) \end{array}$$

---

<sup>2</sup>Thanks to Sam Staton for asking why do we need the **Fam** construction for this.

## Concrete models of ECLNL

The original Proto-Quipper-M model is given by the LNL model: <sup>2</sup>

$$\begin{array}{ccc} & - \odot I & \\ \text{Set} & \xrightarrow{\quad} & \mathbf{Fam}[\overline{\mathbf{M}}] \\ & \perp & \\ & \xleftarrow{\quad} & \\ & \mathbf{Fam}[\overline{\mathbf{M}}](I, -) & \end{array}$$

A simpler model for the same language is given by:

$$\begin{array}{ccc} & - \odot I & \\ \text{Set} & \xrightarrow{\quad} & \overline{\mathbf{M}} \\ & \perp & \\ & \xleftarrow{\quad} & \\ & \overline{\mathbf{M}}(I, -) & \end{array}$$

where in both cases  $\overline{\mathbf{M}} = [\mathbf{M}^{\text{op}}, \mathbf{Set}]$ .

---

<sup>2</sup>Thanks to Sam Staton for asking why do we need the **Fam** construction for this.

## Concrete models of the base language (contd.)

Fix an arbitrary symmetric monoidal category  $\mathbf{M}$ .

Equipping  $\mathbf{M}$  with the free **DCPO**-enrichment yields another concrete (order-enriched) ECLNL model:

$$\begin{array}{ccc} & \xrightarrow{- \odot I} & \\ \text{DCPO} & \xrightarrow{\perp} & \overline{\mathbf{M}} \\ & \xleftarrow{\overline{\mathbf{M}}(I, -)} & \end{array}$$

where  $\overline{\mathbf{M}} = [\mathbf{M}^{\text{op}}, \text{DCPO}]$ .

## A constructive property

Assuming there is a full and faithful embedding of  $E : \mathbf{M} \rightarrow \mathbf{C}$ , then the model enjoys the following property:

$$\mathbf{C}(\llbracket \Phi \rrbracket, \llbracket T \rrbracket \multimap \llbracket U \rrbracket) \cong \mathbf{V}(\langle \Phi \rangle, \mathcal{M}(\llbracket T \rrbracket_{\mathbf{M}}, \llbracket U \rrbracket_{\mathbf{M}}))$$

Therefore any well-typed term  $\Phi; \emptyset \vdash m : T \multimap U$  corresponds to a  $\mathbf{V}$ -parametrised family of string diagrams. For example, if  $\mathbf{V} = \mathbf{Set}$  (or  $\mathbf{V} = \mathbf{DCPO}$ ), then we get precisely a (Scott-continuous) function from  $X$  to  $\mathcal{M}(\llbracket T \rrbracket_{\mathbf{M}}, \llbracket U \rrbracket_{\mathbf{M}})$  or in other words, a (Scott-continuous) family of string diagrams from  $\mathbf{M}$ .

## Abstract model with recursion?

### Definition

An endofunctor  $T : \mathbf{C} \rightarrow \mathbf{C}$  is *parametrically algebraically compact*, if for every  $A \in \text{Ob}(\mathbf{C})$ , the endofunctor  $A \otimes T(-)$  has an initial algebra and a final coalgebra whose carriers coincide.

### Theorem

A categorical model of a linear/non-linear lambda calculus extended with recursion is given by an LNL model:

where  $FG$  (or equivalently  $GF$ ) is parametrically algebraically compact<sup>3</sup>.

---

<sup>3</sup>Benton & Wadler. *Linear logic, monads and the lambda calculus*. LiCS'96.

## ECLNL extended with general recursion

### Definition

A categorical model of ECLNL extended with general recursion is given by a model of ECLNL, where in addition:

5. The comonad endofunctor:

$$\begin{array}{ccc} & - \odot I & \\ \mathcal{V} & \begin{array}{c} \curvearrowright \\ \perp \\ \curvearrowleft \end{array} & \mathcal{C}, \\ & \mathcal{C}(I, -) & \end{array}$$

is parametrically algebraically compact.

## Recursion

Extend the syntax:

$$\frac{\Phi, x : !A; \emptyset \vdash m : A}{\Phi; \emptyset \vdash \text{rec } x^{!A} m : A} \text{ (rec)}$$

Extend the operational semantics:

$$\frac{(C, m[\text{lift } \text{rec } x^{!A} m/x]) \Downarrow (C', v)}{(C, \text{rec } x^{!A} m) \Downarrow (C', v)}$$

# Soundness

## Theorem (Soundness)

*Every model of ECLNL extended with recursion is computationally sound.*

## Concrete model of ECLNL extended with recursion

Let  $\mathbf{M}_*$  be the free  $\mathbf{DCPO}_{\perp!}$ -enrichment of  $\mathbf{M}$  and  $\overline{\mathbf{M}}_* = [\mathbf{M}_*^{\text{op}}, \mathbf{DCPO}_{\perp!}]$  be the associated enriched functor category.

### Remark

If  $\mathbf{M} = \mathbf{1}$ , then the above model degenerates to the left vertical adjunction, which is a model of a LNL lambda calculus with general recursion.

## Computational adequacy

### Theorem

*The following LNL model:*

*is computationally adequate at intuitionistic types for the diagram-free fragment of ECLNL.*

## Future work

- Inductive / recursive types (model appears to have sufficient structure).
- Dependent types (Fam/CFam constructions are well-behaved w.r.t. current models).
- Dynamic lifting.

## Conclusion

- One can construct a model of ECLNL by categorically enriching certain denotational models.
- We described a sound abstract model for ECLNL (with general recursion).
- Systematic construction for concrete models that works for any circuit (string diagram) model described by a symmetric monoidal category.
- Concrete models indicate good prospects for additional features.

Thank you for your attention!

# Syntax

$$\begin{array}{c}
\frac{}{\Phi, x : A; \emptyset \vdash x : A} \text{ (var)} \quad \frac{}{\Phi; \ell : \alpha \vdash \ell : \alpha} \text{ (label)} \quad \frac{}{\Phi; \emptyset \vdash c : A_c} \text{ (const)} \quad \frac{\Phi, \Gamma_1; Q_1 \vdash m : A \quad \Phi, \Gamma_2, x : A; Q_2 \vdash n : B}{\Phi, \Gamma_1, \Gamma_2; Q_1, Q_2 \vdash \text{let } x = m \text{ in } n : B} \text{ (let)} \\

\\
\frac{\Gamma; Q \vdash m : !(T \multimap U)}{\Gamma; Q \vdash \text{box}_T m : \text{Diag}(T, U)} \text{ (box)} \quad \frac{\Phi, \Gamma_1; Q_1 \vdash m : \text{Diag}(T, U) \quad \Phi, \Gamma_2; Q_2 \vdash n : T}{\Phi, \Gamma_1, \Gamma_2; Q_1, Q_2 \vdash \text{apply}(m, n) : U} \text{ (apply)} \quad \frac{\emptyset; Q \vdash \vec{\ell} : T \quad \emptyset; Q' \vdash \vec{\ell}' : U \quad S \in \mathbf{M}_L(Q, Q')}{\Phi; \emptyset \vdash (\vec{\ell}, S, \vec{\ell}') : \text{Diag}(T, U)} \text{ (diag)}
\end{array}$$

## Operational semantics

$$\frac{(S, m) \Downarrow (S', v) \quad (S', n) \Downarrow (S'', v')}{(S, \langle m, n \rangle) \Downarrow (S'', \langle v, v' \rangle)} \quad \frac{(S, m) \Downarrow (S', \langle v, v' \rangle) \quad (S', n[v / x, v' / y]) \Downarrow (S'', w)}{(S, \text{let } \langle x, y \rangle = m \text{ in } n) \Downarrow (S'', w)}$$

$$\frac{}{(S, \text{lift } m) \Downarrow (S, \text{lift } m)} \quad \frac{(S, m) \Downarrow (S', \text{lift } m') \quad (S', m') \Downarrow (S'', v)}{(S, \text{force } m) \Downarrow (S'', v)}$$

$$\frac{(S, m) \Downarrow (S', \text{lift } n) \quad \text{freshlabels}(T) = (Q, \vec{\ell}) \quad (\text{id}_Q, n\vec{\ell}) \Downarrow (D, \vec{\ell}')}{(S, \text{box}_T m) \Downarrow (S', (\vec{\ell}, D, \vec{\ell}'))}$$

$$\frac{(S, m) \Downarrow (S', (\vec{\ell}, D, \vec{\ell}')) \quad (S', n) \Downarrow (S'', \vec{k}) \quad \text{append}(S'', \vec{k}, \vec{\ell}, D, \vec{\ell}') = (S''', \vec{k}')}{(S, \text{apply}(m, n)) \Downarrow (S''', \vec{k}')}$$

$$\frac{(S, m) \Downarrow (S', (\vec{\ell}, D, \vec{\ell}')) \quad (S', n) \Downarrow (S'', \vec{k}) \quad \text{append}(S'', \vec{k}, \vec{\ell}, D, \vec{\ell}') \text{ undefined}}{(S, \text{apply}(m, n)) \Downarrow \text{Error}} \quad \frac{}{(S, (\vec{\ell}, D, \vec{\ell}')) \Downarrow (S, (\vec{\ell}, D, \vec{\ell}'))}$$

## Recursion (contd.)

Extend the denotational semantics:  $\llbracket \Phi; \emptyset \vdash \text{rec } x^!A \ m : A \rrbracket := \sigma_{\llbracket m \rrbracket} \circ \gamma_{\llbracket \Phi \rrbracket}$ .

$$\begin{array}{ccc}
 \llbracket \Phi \rrbracket \otimes ! \llbracket \Phi \rrbracket & \xleftarrow{\text{id} \otimes \text{lift}} & \llbracket \Phi \rrbracket \otimes \llbracket \Phi \rrbracket \xleftarrow{\Delta} \llbracket \Phi \rrbracket \\
 \vdots \downarrow \text{id} \otimes ! \gamma_{\llbracket \Phi \rrbracket} & & \vdots \downarrow \gamma_{\llbracket \Phi \rrbracket} \\
 \llbracket \Phi \rrbracket \otimes ! \Omega_{\llbracket \Phi \rrbracket} & \xleftarrow{\omega_{\llbracket \Phi \rrbracket}^{-1}} & \Omega_{\llbracket \Phi \rrbracket} \\
 \text{id} \downarrow & & \downarrow \text{id} \\
 \llbracket \Phi \rrbracket \otimes ! \Omega_{\llbracket \Phi \rrbracket} & \xrightarrow{\omega_{\llbracket \Phi \rrbracket}} & \Omega_{\llbracket \Phi \rrbracket} \\
 \vdots \downarrow \text{id} \otimes ! \sigma_{\llbracket m \rrbracket} & & \vdots \downarrow \sigma_{\llbracket m \rrbracket} \\
 \llbracket \Phi \rrbracket \otimes ! \llbracket A \rrbracket & \xrightarrow{\llbracket m \rrbracket} & \llbracket A \rrbracket
 \end{array}$$
